Q: Scala - how can I store the result of a chain of function calls? In Scala, I am programming a function that calls other functions, some of which may call other functions etc. I want to store the result of the chain of function calls in a variable like this: val a = b(c(d)) Is there any way to use a function to save the result of the chain of function calls? It seems like the right thing to do would be to make a "function" for this but I don't know what this function is called. It's hard for me to describe this problem. If I were to run a function like this: def b(c:Int):Int = { val a = c; a + c } Then the result of that function would be stored in the variable a. A: You can pass an accumulator to the functions: def f(a: Int)(b: Int): Int = a + b val result = f(4)(4) result // res0: Int = 8 Here a is a parameter of the function f that receives the result of the computation of c in the body of b. The value of a in the body of b is not the same as the a passed to the body of f. A: Try something like this: def b(c: Int)(result:Int):Int = { val a = c a + c result } The function will return the result you pass it, using the local variable you pass in as input. It's an overloaded function: Int is the first input, and result:Int is the second. And of course, it could be more specific, like result:Int = c * 3. Reduced responsiveness to chlorpromazine in schizophrenics: EEG spectral properties in response to locomotor stimulation. To investigate the possibility of altered serotonergic action in schizophrenia, we compared the spectral properties of the EEG in response to locomotor stimulation, a measure that correlates with central serotonergic function, in the high, intermediate and low responders to chlorpromazine (CPZ) in a group of chronic schizophrenic patients. Twenty-two inpatients chronically treated with CPZ completed the Brief Psychiatric Rating Scale and a test of the sensitivity to CPZ. The EEG was recorded

$\delta \gamma ^{a} - \gamma ^{a} \delta \gamma ^{b} \rho _{b} \delta \gamma _{a}.\end{gathered}$$ Conclusions =========== We would like to stress again that our main idea is to show the relation between the Dirac operator and the Dirac equation. We saw that there is not a simple relation between them; in fact, under the presence of torsion, the usual Dirac equation for a massless spin 2 particle becomes an equation whose solutions are in general not spinors.\ To introduce torsion into usual Dirac equation we had to extend the tangent space with torsion and more elements. This is nothing else but to suggest that the spacetime geometry contains torsion. In fact the "true" background geometry is flat spacetime, and the "truest" element of it is the Minkowski metric. In order to find the relation between flat Minkowski spacetime and usual Dirac equation, we have extended the definition of the gamma matrices and this is what we have done in this work. As a result we have been able to find the relation between the eigenvalues of the Dirac operator and the set of the Dirac equation. We have also tried to find the eigenvalues of the Dirac operator in the presence of torsion and we have found that, in general, the eigenvalues of the Dirac operator are not in the same set of the Dirac equation.\ One thing that is lacking in our work is the introduction of torsion into the Dirac equation itself. We would like to stress again that the Dirac equation can be found by extending the spacetime geometry with torsion; this can be done by defining the Poincaré algebra and using the definition of a generalization of the metric $g_{\mu u}$. This brings us to the introduction of torsion into the Dirac equation. The introduction of torsion into the Dirac equation is what the author intended to do in his preprint [@DT]. It is a great pleasure to finish this work in a more relaxed atmosphere and one of the biggest pleasures is that of seeing that we are not the only ones working on this subject.\ [99]{} W.
