Free Mobile Games. Free Games PC. Predictors of disease-free survival in patients with stage I-IIIa cutaneous malignant melanoma treated with surgically based therapy: the impact of tumor ulceration. Our aim was to identify predictors of disease-free survival (DFS) after surgical management of stage I-IIIa cutaneous malignant melanoma (CMM). We reviewed our database of patients treated with wide local excision at a tertiary referral institution between January 1, 1995, and December 31, 2002, for stage I-IIIa CMM and performed univariate and multivariate analyses to determine predictors of DFS. One hundred fifty-nine patients underwent wide local excision, and 38 (24%) were lost to follow-up. The median follow-up period was 10.5 years. The 5-year DFS estimate was 88% for patients with tumors that did not ulcerate and 91% for those with ulcerated tumors ($P = .4$). The 3-year DFS estimate was 96% for patients with tumor thicknesses of less than 1.0 mm and 84% for those with thicker tumors ($P = .001$).
